```
The present sequence is a cDNA encoding novel human protein

(NHP) known as human kinase. The human kinases share structural

similarity with animal kinases, more particularly serine or

threonine protein kinases. Human kinase cDNA is useful for the

detection of mutant human kinase for the diagnosis of disease,

and also as a therapeutic. It is useful for screening drugs

effective in the treatment of symptomatic or phenotypic

manifestations perturbing the normal function of NHP in the

body. The NHP nucleotide sequences are useful for generation of

antibodies, as reagents in diagnostic assays, for the

chiantification of other cellular gene products related to human

kinases, and as reagents in assays for screening compounds that

are useful for treating mental, biological or medical disorders.

NHP oligonucleotides are used as probes. The labelled NHP probes

are useful for screening human genomic library for identifying

polymorphisms and as primers in amplification assays to detect

mutations within the exons, introns and splice sites that can

be used in diagnostics are used to genetically engineer cells

in vivo that functions as bioreactors in the body delivering a

continuous supply of NHP to the body. Nucleotide constructs

encoding functional NHPs are used in gene therapy for the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New isolated human kinase polynucleotide useful for generating antibodies, as reagents in diagnostic assays and for screening for compounds useful for treating mental, biological or medical diseasements.

 S
                                  The present sequence is a cDNA encoding novel human protein (NHP) known as human kinase. The human kinases share structural similarity with animal kinases, more particularly serine or threonine protein kinases. Human kinase cDNA is useful for the detection of mutant human kinase for the diagnosis of disease, and also as a therapeutic. It is useful for screening drugs effective in the treatment of symptomatic or phenotypic manifestations perturbing the normal function of NHP in the body. The NHP nucleotide sequences are useful for generation of antibodies, as reagents in diagnostic assays, for the antibodies, as reagents in diagnostic assays, for the kinases, and as reagents in assays for screening compounds that are useful for treating mental, biological or medical disorders. NHP oligonuclectides are used as probes. The labelled NHP probes are used in diagnostics and pharmacogenomics. Nucleotide construct be used in diagnostics and pharmacogenomics. Nucleotide constructs in vivo that functions as bioreactors in the body delivering a continuous supply of NHP to the body. Nucleotide constructs encoding functional NHPs are used in gene therapy for the modulation of NHP expression.

The present invention relates to an isolated human kinase polypeptide (PKIN) or a biologically active/immunogenic fragment of PKIN. PKIN is useful for diagnosing, treating and preventing cancer (e.g., leukaemia, lymphoma, melanoma), an immune disorder (e.g., acquired immunodeficiency syndrome (AIDS), Addison's disease, allergy, anaemia, asthma, Crohn's cyndrome (AIDS), Addison's disease, allergy, anaemia, asthma, Crohn's bursitis, cirrhosis, hepatitis, psoriasis, Cushing's syndrome), a cardiovascular disorder (e.g., atherosclerosis, hypertension, myocardial infarction), and a lipid disorder (e.g., fatty liver, cholestasis, of Gaucher's disease, Niemann-Pick's disease). PKIN is useful in a number of drug screening techniques and to analyse the proteome of a bissue or cell type. PKIN is useful for creating knockin humanised animals or transgenic animals to model human diseases, in somatic or germline gene therapy, to differences in the chromosomal location due to translocation, inversion, etc., among normal, carrier or affected individuals, and as hybridisation probes for mapping naturally occurring genomic sequences. PKIN is useful in southern or northern analysis, dot blot or other membrane-based technologies, in PCR technologies, in dipstick, pin, multiformat enzyme linked immunosorbent (EDISA)-like assays and in microarrays utilising fluids or tissues from patients to detect altered PKIN expression. The present sequence is human PKIN-10 cDNA.
                                                                                                         kinase polypeptide, useful in diagnosis, prevention of cancer, immune disorder, growth and developmental cardiovascular disorder and lipid disorder -
                                                                                                                                                                                                                  Claim 5; Page 183; 196pp; English

                                                                                                                                                                                                                                                                                                                                                                              숭
                                                                           ठे
                                                                                                                                                              ठे
                                                                                                                                                                                                                                  This invention relates to the CDNA and protein sequences of fifty six polynucleotides for diagnostics and therapeutics (DITHP). The humar DITHP polynucleotides and polypeptides are useful for diagnosing, preventing or treating diseases associated with, as well as effects of exogenous compounds, on the expression of human molecules, such as cell proliferative diseases (e.g. cancer, arteriosclerosis atherosclerosis, promary thrombocytopenia), autoimmune/inflammatory diseases (e.g. anaemia, asthma, autoimmune thyroiditis, Crohn's disease, diabetes cell architis, uveitis, acquired immunodeficiency disease, AlDS; allergies; architis, uveitis, acquired immunodeficiency disease, AlDS; allergies; neurological disorders (e.g. stroke, Alzheimer's disease, dementia, architis, uveitis, acquired immunodeficiency disease, AlDS; allergies; neurological disorders (e.g. hyperprathyroidism, hypercholesterolaemia, endocrine disorders (e.g. hyperprathyroidism, hypercholesterolaemia, hyperlipidemia, obesity), connective tissue disorders (e.g. osteoporosis, Reiter's syndrome), or infections (e.g. bacterial, viral, fungal, parasitic, protozoal). The DITHP sequences may be used to courring genomic asquences. They are also useful in designing probes useful in diagnostic assays. The polymucleotides are useful as molecular weight markers, or as antigen to elicit an immune response. The present sequence ceptuse human diagnostics and therapeutics (DITHP) connective of the invention.

                                                                               AASO6701-AASO6757 encode for novel human protein kinases #1-57. The novel protein kinases have been identified as members of the tyrosine or serine/threonine kinase (PTK and STK) families. The polynucleotides cor serine/threonine kinase (PTK and STK) families. The polynucleotides protein kinases and the polypeptides may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate kinase expression. For example, they may be used to treat cancers (especially cancers of haematopoietic origin), cardiovascular disease (e.g. atherosclerosis), metabolic disorders (e.g. diabetes), immune related diseases (e.g. rheumatoid arthritis), neurological disease (e.g. schizophrenia), neurodegenerative disorders (e.g. disease), inflammatory disorders (e.g. infertility).

Additionally, polynucleotides encoding protein kinases may be used for gene therapy and as DNA probes in diagnostic assays.

The protein kinase polypeptides may be used as antigens in the production of antibodies against the protein kinases and in assays to identify modulators of protein kinase expression and activity.

The present sequence is a cDNA encoding novel human protein (NHP) known as human kinase. The human kinases share structural similarity with animal kinases, more particularly serine or threonine protein kinases. Human kinase cDNA is useful for the detection of mutant human kinase cDNA is useful for the detection of mutant human kinase for the diagnosis of disease, and also as a therapeutic. It is useful for screening drugs effective in the treatment of symptomatic or phenotypic manifestations perturbing the normal function of NHP in the body. The NHP nucleotide sequences are useful for generation of antibodies, as reagents in diagnostic assays, for the antibodies, as reagents in assays for screening compounds that are useful for treating mental, biological or medical disorders. NHP oligonucleotides are used as probes. The labelled NHP probes are used as probes. The labelled hat can be useful for screening human genomic library for identifying polymorphisms and as primers in amplification assays to detect mutations within the exons, introns and splice sites that can be used in diagnostics and pharmacogenomics. Nucleotide constructs encoding NHP products are used to genetically engineer cells in vivo that functions as bioreactors in the body delivering a continuous supply of NHP to the body. Nucleotide constructs encoding functional NHPs are used in gene therapy for the

The present sequence is a cDNA encoding novel human protein (NHP) known as human kinase. The human kirases share structural similarity with animal kinases, more particularly serine or threonine protein kinases, Human kinase cDNA is useful for the detection of mutant human kinase for the diagnosis of disease, and also as a therapeutic. It is useful for screening drugs effective in the treatment of symptomatic or phenotypic manifestations perturbing the normal function of NHP in the body. The NHP nucleotide sequences are useful for generation of antibodies, as reagents in diagnostic assays, for the intendication of other cellular gene products related to human kinases, and as reagents in assays for screening compounds that are useful for treating mental, biological or medical disorders. NHP oligonucleotides are used as probes. The labelled NHP probes are used as probes. The labelled MHP products are used as probes. The labelled construct constitutions within the exons, introns and splice sites that can be used in diagnostics and pharmacogenomics. Nucleotide constructs in vivo that functions as bioreactors in the body delivering a continuous supply of NHP to the body. Nucleotide constructs endulation of NHP in the body. Nucleotide constructs

The invention relates to an isolated 14257 polypeptide and nucleic acid encoding it. The 14257 protein is a protein kinase that acts as a modulating agent in regulating a variety of cellular processes, including cell proliferation, differentiation, growth and division. The activity of the protein of the invention may be described as; cytostatic; osteopathic; hepatotropic; antidiabetic; neuroprotective; antiarthritic; dermatological; immunosuppressive, antinilammatory; antiarthyroid; antiatherosclerotic; hypotensive; vasotropic; antiarthythmic; virucide; anorectic; metabolic; immunomodulator and analgesic. The protein of the invention may act as a novel diagnostic target or therapeutic agent controlling certain disorders, for example kinase-associated or other 14257-associated disorders uch as cancers e.g. acute lymphoblastic leukemia or Hodgkin's disorders such as cancers include bone metabolism disorders such as osteoporosis, disorders of the immune system, e.g. inflammatory, diabetes mellitus, osteoarthritis and asthma. Proteins of the invention may also be of use as therapeutic agents in cardiovascular disorders such as hypertension and coronary artery disease, and some endothelial cell disorders, including psoriasis. The current sequence represents a human kinase 14257 cDNA.
                                                                                                                                                                                                                                                                                                                              example

The present sequence encodes a novel protein kinase. The nucleic acids and the protein kinases they encode may be used in the treatment and diagnosis of diseases associated with inappropriate kinase expression such as immune-related diseases and disorders, cardiovascular disease, complementary sequences may also be used as DNA probes in diagnostic assays. The kinase polypeptides may be used as antigens in the production of antibodies of kinase expression and activity. Anti-kinase antibodies and kinase expression and activity. Diseases related to down regulate kinase expression and activity. Diseases related to kinase expression and activity include rheumatoid arthritis, atherosclerosis, autoimmune disorders, cardiomyopathies, strokes, renal failure, immune disorders cardiomyopathies, chronic inflammatory bowel disease, chronic inflammatory pelvic disease, multiple sclerosis, asthma, osteoarthritis, psoriasis, rhinitis, autoimmunity, diabetes, cancers and reproductive disorders. 668 909 728 acids encoding kinase polypeptides, useful for diagnosing and jimune-related diseases and disorders, cardiovascular disease yenerative diseases and/or cancers -Human; mouse; protein kinase; antiarthritic; antisclerotic; osteopath: immunosuppressive; cardiant; renal; antiinflammatory; antiasthmatic; dermatological; antidiabetic; antiinfertility; gene therapy; vaccine; immune discrder; cardiovascular disease; neurodegenerative disease; cancer; autoimmune disorder; stroke; inflammatory bowel disease; inflammatory pelvic disease; multiple sclerosis; psoriasis; ss. 655 T; 0 other; S Sudersanam G; 258 **4** SEQ ID NO: C; 178 à English ВР Whyte 911 A; 182 2000WO-US14842 99US-0136503 Novel protein kinase cDNA, entry) 310pp; CDNA; ď Martinez 293 (first WPI; 2001-032161/04 P-PSDB; AAB65642. standard; HNC. 5: neurodegenerative 8P; 4; F19 WO200073469-A2 SUGEN 911 26-MAY-2000; Homo sapiens 8-MAY-1999; 07-DEC-2000 g, 27-MAR-2301 AAF44669; AAF44669 treating 699 Seguence 609 541 109 729 (SUGE-) Plowman Nucleic Example RESULT AAF4466 g õ ò

The present sequence encodes a novel protein kinase. The nucleic acids and the protein kinases they encode may be used in the treatment and diagnosis of diseases associated with inappropriate kinase expression such as immune-related diseases and disorders, cardiovascular disease, neurodegenerative diseases and/or cancers. The nucleic acids and complementary sequences may also be used as DNA probes in diagnostic assays. The kinase expression and activity. Anti-kinase antibodies and kinase antagonists may also be used to down regulate kinase antibodies antibodies antibodies of kinase expression and activity include rheumatoid arthritis, atherosclerosis, autoimmune disorders, cardiomyopathies, strokes, renal failure, immune disorders, cardiomyopathies, strokes, renal failure, oxidative-stress related disorders, chronic inflammatory bowel disease, chronic inflammatory pelvic disease, multiple sclerosis, asthma, osteoarthritis, psoriasis, rhinitis, autoimmunity, diabetes, cancers and reproductive disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        'n

This invention describes a novel disease detection and treatment molecule polypeptide (MDDT) which has anti-inflammatory, immunosuppressive, costeopathic, cytostatic, anti-HIV, haemostatic, nephrotropic, antianaemic, antipsoriatic and hepatotropic activity. The polynucleotides and the polypeptides of the invention can be used for gene therapy, protein replacement therapy and are useful for treating a variety of diseases or conditions. These polypeptides or polynucleotides are protein replacement therapy and are useful for treating or preventing cell proliferative disorders (e.g. cancers including adenocarcinoma, including adenocarcinoma, including including adenocarcinoma, including including adenocarcinoma, selectiones, inflammation, osteoporosis, thrombocytopaenia, psoriasis or hepatitis, ABX34440-ABX34835 encode the MDDT polypeptides represented in hepatitis, ABX34440-ABX34835 encode the MDDT polypeptides represented in ABUI1450-ABUI1845, described in the disclosure of the invention.

NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at the wipo.int/pub/published_pot_sequences.

                                                                        Ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence encodes a novel human protein (NHP) which of the bresent sequence. The human kinases share structural of the present sequence. The human kinases share structural similarity with animal kinases, more particularly serine or the claim protein kinases. Human kinase son a seful for the diagnosis of disease, and also as a therapeutic. It is useful for screening drugs of fective in the treatment of symptomatic or phenotypic manifestations perturbing the normal function of NHP in the continuous perturbing the normal function of NHP in the continuous perturbing the normal function of the human continuous for screening carpounds that identification of other cellular gene products related to human kinases, and as reagents in assays for screening compounds that are useful for treating mental, biological or medical disorders. NHP oligonucleotides are used as probes. The labelied NHP probes are useful for screening human genomic library for identifying polymorphisms and as primers in amplification assays to detect mutations within the exons, introns and splice sites that can be used in diagnostics and pharmacogenomics. Nucleating can

AB277126 to AB277165 encode the human protein kinases given in ABP96048 to ABP96087. The protein kinases have antiasthmatic, antinflammatory, antidiabetic, antiparkinsonian, antimigraine, cardiant, cytostatic, immunosuppressive and vulnerary activities, and can be used in gene therapy. A protein kinase therapeutic agent from the present invention, particularly a protein kinase gene agonist or antagonist, can be used for treating a disease or condition associated with a protein kinase in an individual. These diseases include chronic obstructive pulmonary diseases (COPD), asthma, non-insulin dependent diabetes, Parkinson's disease, migraine, myocardial infarction, inflammatory bowel disease, autoimmune disorders (e.g. allograft rejection or graft vs. host disease), cancers (e.g. leukaemias) or wound granulation.

New isolated human kinase polynucleotide useful for generating antibodies, as reagents in diagnostic assays and for screening for compounds useful for treating mental, biological or medical diseases
                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence is a cDNA encoding novel human protein

(NHP) known as human kinase. The human kinases share structural

similarity with animal kinases, more particularly serine or

threonine protein kinases. Human kinase cDNA is useful for the

detection of mutant human kinase for the diagnosis of disease,

and also as a therapeutic. It is useful for screening drugs

effective in the treatment of symptomatic or phenotypic

manifestations perturbing the normal function of NHP in the

body. The NHP nucleotide sequences are useful for generation of

antibodies, as reagents in diagnostic assays, for the

chartification of other cellular gene products related to human

kinases, and as reagents in assays for screening compounds that

are useful for treating mental, biological or medical disorders.

NHP oligonucleotides are used as probes. The labelled NHP probes

are useful for screening human genomic library for identifying

polymorphisms and as primers in amplification assays to detect

mutations within the exons, introns and splice sites that can

be used in diagnostics and pharmacogenomics. Nucleotide construct

encoding NHP products are used to genetically engineer cells

in vivo that functions as bioreactors in the body delivering a

continuous supply of NHP to the body. Nucleotide constructs

encoding functional NHPs are used in gene therapy for the

modularion of NHP encodes.

/product= "Human kinase #4"
/note= "The coding region does not include stop codon"
                                    New isolated human kinase polynucleotide useful for generating antibodies, as reagents in diagnostic assays and for screening for compounds useful for treating mental, biological or medical diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence is a cDNA encoding novel human protein

(NHP) known as human kinase. The human kinases share structural
similarity with animal kinases, more particularly serine or
threonine protein kinases. Human kinase cDNA is useful for the
detection of mutant human kinase for the diagnosis of disease,
and also as a therapeutic. It is useful for screening drugs
effective in the treatment of symptomatic or phenotypic
manifestations perturbing the normal function of NHP in the
body. The NHP nucleotide sequences are useful for generation of
antibodies, as reagents in diagnostic assays, for the
identification of other cellular gene products related to human
kinases, and as reagents in assays for screening compounds that
are useful for treating mental, biological or medical disorders.
NHP oligonucleotides are used as probes. The labelled NHP probes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ď

```
are useful for screening human genomic library for identifying polymorphisms and as primers in amplification assays to detect mutations within the exons, introns and splice sites that can be used in diagnostics and pharmacogenomics. Nucleotide construct encoding NHP products are used to genetically engineer cells in vivo that functions as bioreactors in the body delivering a continuous supply of NHP to the body. Nucleotide constructs encoding functional NHPs are used in gene therapy for the modulation of NHP expression.

Sequence 3, Application US/09411628

Patent No. 6428994

GENERAL INFORMATION:
APPLICANT: University of Southern California
TITLE OF INVENTION: CDNA, GENOMIC, AND PREDICTED PROTEIN
TITLE OF INVENTION: SEQUENCES OF LEARNING-INDUCED KINASES
FILE REFERENCE: 13761-707
CURRENT APPLICATION NUMBER: US/09/411,628
CURRENT FILING DATE: 1999-10-01
EARLIER APPLICATION NUMBER: US 6C/102,906
EARLIER FILING DATE: 1998-10-02
NUMBER OF SEQ ID NOS: 16

SOFTWARE: FastSEQ for Windows Version 4.0

; Patent No. 6518021
; GENERAL INFORMATION:
; APPLICANT: Ole THASTRUP, et al.
; TITLE OF INVENTION: A Method For Extracting Qu.; TITLE OF INVENTION: On A Cellular Response
; FILE REFERENCE: 3759-0110P
; CURRENT APPLICATION NUMBER: US/09/417,197
; CURRENT FILING DATE: 1999-10-07
; NUMBER OF SEQ ID NOS: 143

Genome. 12, 673-677 (2001)

Normalization and subtraction of cap-trapper-selected cDNAs to prepare full-length cDNA libraries for rapid discovery of new genes. Genome Res. 10 (10), 1617-1630 (2000)

RIKEN integrated sequence analysis (RISA) system--384-format sequencing pipeline with 384 multicapiliary sequencer. Genome Res. 10 (11), 1757-1771 (2000)

Computer-based methods for the mouse full-length cDNA encyclopedia: real-time sequence clustering for construction of a nonredundant cDNA library. Genome Res. 11 (2), 281-289 (2001) cDNA library was prepared and sequenced in Mouse Genome Genome Exploration Research Group in Riken Genomic Sciences Center and Genome Science Laboratory in RIKEN.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Adachi, J., Aizawa, K., Akimura, T., Arakawa, T., Carninci, P., Fukuda Adachi, J., Aizawa, K., Akimura, T., Arakawa, T., Carninci, P., Fukuda, S., Hashizume, W., Hayashida, K., Hirozane, T., Hori, F., Imotani, K., Ishii, Y., Itoh, M., Kagawa, I., Kawai, J., Kojima, Y., Kondo, S., Konno, H., Koya, S., Miyazaki, A., Murata, M., Nakamura, M., Nomura, K., Numazaki, R., Ohno, M., Ohsato, N., Saito, R., Sakazume, N., Sano, H., Sasaki, D., Sato, K., Shibata, K., Shiraki, T., Tagami, M., Takeda, Y., Waki, K., Wataniki, A., Muramatsu, M. and Hayashizaki, Y. Computer-based methods for the mouse full-length cDNA conputer-based methods for the mouse full-length cDNA construction of a encyclopedia: real-time sequence clustering for construction of a nonredundant cDNA library. Genome Res. 11 (2), 281-289 (2001) cDNA library was prepared and sequenced in Mouse Genome Encyclopedia Project of Genome Exploration Research Group in Riken Genomic Sciences Center and Genome Science Laboratory in RIKEN. Division of Experimental Animal Research in Riken contributed to prepare mouse tissues.

Tissues were provided by Kirk W. Beisel (Boys Town National Research Hospital 555 North 30th Street Omaha, NE 68131 USA) whose assistance we gratefully acknowledge.

| /note="Organ: whole embryo; Vector: pBluescript II KS(+);
| Site l: EcoRI; Site 2: Not1; This normalized library was constructed from I million independent clones. CDNA synthesis was initiated using an oligo(dT) primer, using methylated C in the first strand synthesis reaction.
| Following this first strand reaction, double-stranded CDNA was blunted, ligated to NotI adapters, digested with EcoRI compatible sites of a custom modified MCS of the pBluescript (KS+) vector. The library was normalized in 2 counds using conditions adapted from Soares et al., PNAS (1994) 91: 9228-9232 and Bonaldo et al., Genome Research 6 (1994) 91: 791, except that a significantly longer reannealing hybridization was used."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       BU221831
